<b>Vue</b>		
Version used	1.0.26	
Language used	ES6	
<b>Templating logic</b>		
<b>Vue</b>		
Text interpolation	<code>{{ message }}</code>	
Transform interpolation	<code>{{ message   filter }}</code>	
Transform with arguments	<code>{{ message   filter 'arg1' arg2 }}</code>	
Bind text content	<code>&lt;div v-text="message"&gt;</code>	
Bind dangerous html content by directive	<code>&lt;div v-html="message"&gt;</code>	
Bind href	<code>&lt;a v-bind:href="url"&gt;&lt;/a&gt;</code> <code>&lt;a v-link="url"&gt;&lt;/a&gt;</code> With official vue-router plugin is the best way, I think.	But we can use shorthand syntax like <code>&lt;a :href="url"&gt;&lt;/a&gt;</code> Anyway, both methods are not recommended.
Dangerous raw HTML output	<code>{{{ raw_html }}}}</code>	
Bind attribute value	<code>&lt;div id="item-{{ id }}"&gt;</code>	
DOM add/remove	<code>&lt;div v-if='shouldShow'&gt;</code> And <code>&lt;div v-else='shouldShow'&gt;</code>	
DOM show/hide	<code>&lt;div v-show='shouldShow'&gt;</code> And <code>&lt;div v-else='shouldShow'&gt;</code>	
Repeat	<code>&lt;div v-for="(index, item) in items"&gt;&lt;/div&gt;</code> <code>&lt;div v-for="(key, val) in object"&gt;&lt;/div&gt;</code>	
Bind event handler	<code>&lt;button v-on:click="clicked"&gt;</code> Or just <code>&lt;button @click="clicked"&gt;</code> <code>&lt;form @submit.stop.prevent="submit"&gt;</code> <code>&lt;input @keyup.enter="save"&gt;</code>	
<b>Components</b>		
<b>Vue</b>		
Define component ES6	<code>class Polyglot extends Vue</code>	Also you can define collections of components directly in property «components» of vue instance, using ES6 syntax <code>{Comp1,Comp2,Comp3}</code>
Define component ES5	<code>Vue.extend({})</code> <code>Vue.component(name, {})</code>	
<b>Component communication</b>		

Vue	
One-way data binding	<code>&lt;child :foo='bar' /&gt;</code>
String literal prop	<code>&lt;child foo='bar' /&gt;</code>
Two-way binding (native)	<code>&lt;input v-model="foo" /&gt;</code>
Two-way binding (components)	<code>&lt;child :foo.sync="bar"&gt;&lt;/child&gt;</code>
One-time binding	<code>&lt;child :foo.once="bar" /&gt;</code>
Component internal state	
Vue	
Set initial state	<pre> data: {   foo: 1 } data: {   return {     model: {},     collection: []   } } </pre>
	If you need to set nested data values, you have to use function returning value
Set state	<code>this.foo = 2</code>
Property validation	
Vue	
Prop validation key	<code>{props: {}}</code>
Required props without type	<code>{email: {required: true}}</code>
Prop validate Number	<code>{myNum: Number}</code>
Prop validate String	<code>{myStr: String}</code>
Prop validate Array	<code>{myArr: Array}</code>
Prop validate Boolean	<code>{myBool: Boolean}</code>
Prop validate Function	<code>{myFunc: Function}</code> <span style="float: right;">Now supported</span>
Prop validate Object	<code>{myObj: Object}</code>
Prop validate Date	<code>{myDate: Date}</code> <span style="float: right;">It's not documented, but I have some experience with this feature and don't have any errors</span>
Prop validate union	<code>{myVar: [String, Number]}</code>
Component lifecycle methods	
Vue	
Initialized	<code>created</code>
Before compile template	<code>beforeCompile</code>
After compile template	<code>compiled</code>
DOM Ready	<code>ready</code>
On prop change	<code>none</code>
Component updated	<code>none</code>
Before destroy	<code>beforeDestroy</code>
After destroy	<code>destroyed</code>
